Boom Trucks

Boom Trucks Training St Catharines - A boom truck is sometimes recognized by the cable and phone company vehicles that have the extended arm folded over their roofs. Typically, a bucket-like apparatus sits at the extension of extendable arms. Sometimes labeled a cherry picker, or an aerial boom vehicle, a bucket truck has an extendable boom installed on the roof or bed. It can transport workers to the top of a phone or electrical pole. Bucket boom vans have a lifting capacity of roughly 350 lbs to 1500 lbs or 158 kg to 680 kg and are capable of extending the bucket up to 34 feet or to around 10 meters into the air.

Heavy equipment boom trucks or construction boom trucks may have a hoist attached to the rear. These cranes often called knuckle booms may be little and compact or be of the trolley boom variety, where the crane is capable of extending the length of the vehicle bed. Crane boom trucks have a raising capability between 10 to 50 tons or approximately 9 to 45 metric tons.

An added modification of boom truck is the concrete boom, which have a tube with a nozzle at the end of the vehicle to pump concrete and other resources. The areas where these materials need to be deposited is commonly inaccessible to the truck or is located at a considerable height, for that reason, the boom of a bigger concrete boom vehicle may well be extended 230 feet or just about 71 meters. The truck then pumps the concrete through the boom precisely depositing it into the space where it is required.

Fire engines are normally equipped with a boom bucket able to elevate firefighters up to the higher floors of buildings. Moreover, this boom will permit firefighters to aim the flow of water or to engage or rescue ensnared victims. Many of the older hook and ladder trucks have been replaced by modern boom trucks.

There is also a small self-propelled boom vehicle, comparable to a forklift that is existing on the market for sizable warehouses or manufacturing plants. These mini boom trucks may lift workers to upper storage areas or to the ceiling of the building. They are much safer and more steady than using an extension ladder for the same application.
